SUMMARY

Backend Developer with 5 years of experience building scalable APIs and distributed systems, currently specializing in blockchain development. Proficient in TypeScript, Node.js, Golang, and Python, with hands-on experience in smart contract development (Solidity, ERC-20/ERC-721), DeFi protocols, and Hyperledger Fabric. Proven track record of delivering measurable results — including a 75% reduction in API response time and \$3,000/month in cost savings through service internalization. Experienced in microservices architecture, Azure Service Bus, Elasticsearch, Docker, and AWS. Native Portuguese speaker with advanced English.

EXPERIENCE

GoLedger | Blockchain Developer

06/2025 – Present

- Write and deploy smart contracts (ERC-20, ERC-721) on Ethereum and Hyperledger Fabric, including a production NFT solution for vehicle document tokenization in partnership with DETRAN
- Develop and audit smart contracts using Slither for static analysis and Multisig wallets for secure transaction management
- Build and maintain Subgraphs for on-chain data indexing, enabling efficient querying of DeFi protocol events
- Integrate blockchain networks with external systems using Golang and Solidity, ensuring security compliance and auditability
- Configure and manage KMS infrastructure for cryptographic key handling across blockchain environments

Jazida | Back-end Developer

04/2024 – 06/2025

- Maintained and evolved a microservices architecture composed of 4+ services (Node.js/Express, NestJS, Golang, Python), each handling distinct domains including geospatial indexing, PDF processing, and public government data ingestion
- Reduced API response time from ~2s to 0.5ms on critical endpoints through query optimization and caching strategies
- Led internalization of a third-party service, eliminating \$3,000/month in external costs while improving reliability and maintainability
- Built an Elasticsearch-powered indexing service with NestJS for geospatial data and image search used in an interactive map product
- Managed asynchronous processing pipelines using Azure Service Bus for high-throughput background jobs
- Implemented observability practices including structured logging and queue monitoring across distributed services

Dinheirow | Back-end Developer

03/2022 – 04/2024

- Developed and maintained APIs for a payroll loan (crédito consignado) fintech platform, ensuring reliability and compliance with financial regulations
- Refactored compliance scoring logic, improving user credit evaluation accuracy and reducing processing complexity
- Optimized critical endpoints, directly improving response times and system throughput for a high-volume financial product
- Mentored and led a team of 3 (2 interns + 1 junior developer), conducting code reviews and ensuring consistent delivery quality
- Applied clean architecture principles and design patterns to improve maintainability and scalability across the codebase

SKILLS

Languages & Runtimes: TypeScript • Node.js • Golang • Python • JavaScript

Blockchain: Solidity • Hardhat • Ethers.js • OpenZeppelin • Hyperledger Fabric • Hyperledger Besu • Subgraph • Slither • Multisig • KMS • Pinata

Frameworks & Tools: Express • NestJS • React • Redux • Docker • AWS • Azure Service Bus • Elasticsearch

Databases: MySQL • MongoDB

Testing: Jest • Mocha • RTL

EDUCATION

Bachelor's Degree in Business Administration — PUC Campinas | 2020

Bachelor's Degree in Computer Science — Descomplica | Expected 12/2027

CERTIFICATIONS

AWS Certified Cloud Practitioner — Amazon Web Services (AWS) | 2026

Full-stack Web Development — Trybe | 2022

English Language Course — ISI Dublin | 2017

LANGUAGES

Portuguese — Native | English — Advanced
